What Is a Standard?

A standard is a document that provides requirements, specifications, guidelines or characteristics that can be used consistently to ensure that materials, products, processes and services are fit for their purpose.

<http://www.iso.org/iso/home/standards.htm>

More Important, Why Standardize?

- Interoperability (size, shape, frequency, voltage),
- Performance (capacity, strength, lifespan, flexibility)
- Safety (impact resistance, fire resistance, labeling)
- Consistent terminology for the above functionality
- Consistent tests for the above functionality
- Consumer confidence to enable a market

1 SCOPE

This International Standard specifies physical and performance requirements, methods of test and marking requirements for industrial safety helmets.

3 DEFINITIONS

3.1

safety helmet

A helmet primarily intended to protect the upper part of a wearer's head against a blow.

3.2

shell

The hard, smoothly finished material that provides the general form of the helmet.

3.3

peak

A permanent extension of the shell above the eyes.

3.4

brim

A rim surrounding the shell.

What are the words for the ANSI acronym?

American National Standards Institute

ANSI is a private organization, coordinating the U.S. consensus standards system, providing a neutral forum for the development of policies on standards issues and serves as a watchdog for standards development and conformity assessment programs and processes by accrediting and auditing standards developers.

1,073 Total ANSI Members
605 Company Members
343 Organizational Members
64 Government Members
23 Educational/Institutional Members
38 International Members

240 ANSI-Accredited Standards Developers (ASDs)
11,368 Approved American National Standards (ANS)

All Standards, Specifications,
Guidelines are not ANSI Standards,
but all American National Standards
(ANS) are ANSI Standards

So What Do You Get with an ANS Process?

- open, balanced group of interested/affected people (consensus body)
- broad-based, open public review/comment on draft standards
- anyone can comment and be considered during public review
- incorporation of approved changes into a draft standard
- right to appeal if due process was not respected

openness, balance, consensus and due process

Many American National Standards (ANS) become ISO standards

One example is the intermodal freight container

Who develops the standards that affect your everyday lives (for example: bicycle helmets, concrete strength, safety signage, USB drive size, gasoline octane levels, Wi-Fi, etc.)?

... ~~well maybe~~ *well maybe* the future you

Most people think there is a group of people (hopefully, smart, caring, people) in Washington or some other big city, that know everything about everything and they develop all the standards.

Look to your left and look to your right...for better or worse...those are the people that will be creating your standards!

What is the mechanical engineering professional organization you can join as a student?

ASME

*Approximately
4700 volunteers*

<https://www.asme.org/about-asme/standards>

ASME is the leading international developer of codes and standards associated with the art, science, and practice of mechanical engineering. Starting with the first issuance of its legendary Boiler & Pressure Vessel Code in 1914, ASME's codes and standards have grown to nearly 600 offerings currently in print. These offerings cover a breadth of topics, including pressure technology, nuclear plants, elevators / escalators, construction, engineering design, standardization, and performance testing.

What is the mechanical engineering professional organization you can join as a student?

SAE

*Approximately
9000 volunteers*

<http://standards.sae.org/>

SAE standards are internationally recognized for their role in helping ensure the safety, quality, and effectiveness of products and services across the mobility engineering industry.

Almost 10,000 SAE documents created through consensus standards development by more than 240 SAE Technical Committees with 450+ subcommittees and task groups, plus 60 US Technical Advisory Group (USTAG's) to ISO Committees.

BOILER AND PRESSURE VESSEL CODE (BPVC) 2015 *[over 100 years]*

go.ASME.org/BPVC15

SECTION I -- POWER BOILERS

Provides requirements for all methods of construction of power, electric, and miniature boilers; high temperature water boilers, heat recovery steam generators, and certain fired pressure vessels to be used in stationary service; and power boilers used in locomotive, portable, and traction service. Rules pertaining to use of the single ASME certification mark with the V, A, M, PP, S, and E designators are also included.

ISO 5079:1995, Textile fibres -- Determination of breaking force and elongation at break of individual fibres

Prepared by Technical Committee ISO/TC 38, *Textiles*, Subcommittee SC 6, *Fibre testing*

Describes method and conditions of test for the determination of the breaking force and elongation at break of individual fibres in the conditioned or wet state. The test is restricted to the use of constant-rate-of-extension testing apparatus. Applicable to all types of fibres.

Surface Vehicle Recommended Practice - Electric Vehicle Conductive Charge Coupler

Battery packs are still generally non-standard and
vary greatly from vehicle to vehicle

General physical, electrical, communication protocol, and performance requirements for the electric vehicle conductive charge system and coupler.

Added to IEC 62196-2 standard (Dimensional compatibility and interchangeability requirements for a.c. pin and contact-tube accessories).

The companies participating in or supporting the revised 2009 standard include Smart, Chrysler, GM, Ford, Toyota, Honda, Nissan, and Tesla.

Standards are enforceable as laws	Circle one of the choices below		
	YES	NO	<input checked="" type="radio"/> It depends

ANSI and ISO standards are voluntary

Adopt them or don't, it is up to you!

However, if the Code of Federal Regulations or a Building Code references the standard for work you, your company, or your employees are doing, then you follow the standard.

If your client references that you must follow a standard, again you can voluntarily choose not to follow the standard...
...and therefore voluntarily choose not to have their business

How long (number of months from inspiration to publication) does it take to develop an ANSI standard? An ISO standard?

ANSI	It depends... min 1+30+45+1 days* ^A	ISO	It depends... on a lot of factors
-------------	----------------------------------------------------------	------------	---------------------------------------------

*A

- assuming the ASME CSC agrees to give idea consideration on day one
- then ASME/ANSI posts public announcement in *Standards Action* (30 days)
- then complete draft document is created/completed during the 30-day period
- draft is posted instantly for public comment after the 30-day mark by ANSI
- then after 45 days there is complete agreement with no comments
- then the next morning, the ANSI standards review board gave its blessing
- then that afternoon, the standard could be published by ASME

The above is a fantasy world. More likely is 2-4 years of multiple committee meetings, ballots, comment review periods, revisions, administrative/committee/member communication delays, formatting, etc.

Should

Recommendation of good practice, but not mandated
(shoulds allow judgement calls)

VS.

Shall

Mandatory requirement to follow the standard.
(shalls give a standard its teeth)

Performance Standards

Specify clearly how something should/shall perform by providing clear guidance regarding what is desired and how to measure that performance

VS.

Prescriptive Standards

Specify exactly how something should/shall be done by providing clear guidance regarding materials, dimensions, processes, procedures, etc.
